

【Division of Livestock Production Research & Support】

1. Promotion of researches that contributes to sustainable industrial animal production shown below;
 - The study on enhancement of the productive efficiency in livestock animals (longevity and productivity, efficient production, prevention of loss, genetic improvement, non-invasive evaluation)
 - Improvement and optimization of rearing system (protocol for proper rearing, nutrition management, hygiene management)
 - Buildup of forage production infrastructure (dwarf napier grass, self-supplied roughage, cropping system, grazing, production and development of alternative forages to concentrates)
 - Buildup of livestock production infrastructure (production of animal-derived food, probiotics, low-cost disease control)
 - Feed resource development (self-supplied feedstuff, unused or little-used feed resource, eco-feed, functional feed, silage)
 - Buildup of epidemic prevention base (wildlife, pathogen transmission, food safety)
 - A livestock operating model considered for proper rearing density (rearing livestock density, an operating model)
 - Regional transportation planning learned from FMD disasters (roadblock disinfectant stations)
2. Strengthening cooperation with prefectures and districts and research support
 - Participate in meetings and projects of prefectures and livestock-related organizations
 - Conduct joint research and technical support with livestock farmers
3. Strengthening the research network and supporting the development of the next generation /
 - Hold seminars by visiting researchers
